REPORT NUMBER AC-65-66-1 PUB DATE APR 66
EDRS PRICE MF-$0.09 HC-$2.24 56P.

DESCRIPTORS- *COLLEGE STUDENTS, *COURSES, *UNITS OF STUDY (SUBJECT FIELDS), STATISTICAL DATA, COMPARATIVE ANALYSIS, STORRS

SIXTY-FOUR STUDY AREAS INCLUDING 52 MAJORS WERE GROUPED INTO SIX BROAD CATEGORIES IN THE COLLEGE OF LIBERAL ARTS AND SCIENCES AND SEVEN PROFESSIONAL SCHOOLS. THE TRANSCRIPTS OF GRADUATES WERE REDUCED TO DATA CARDS AND ANALYZED BY COMPUTER. THE FINDINGS INDICATED THAT (1) WORK TAKEN WITHIN THE MAJOR RANGED FROM A LOW OF 23 PERCENT FOR EDUCATION TO A HIGH OF 53 PERCENT FOR FINE ARTS, (2) LIBERAL ARTS MAJORS TOOK 86 PERCENT OF THEIR WORK IN THE COLLEGE OF LIBERAL ARTS AND VERY LITTLE IN THE PROFESSIONAL SCHOOLS, (3) MAJORS IN MATHEMATICS AND THE BIOLOGICAL AND PHYSICAL SCIENCES TOOK A LARGE PROPORTION OF THE WORK IN THE HUMANITIES AND SOCIAL SCIENCES, BUT HUMANITIES AND SCHOOL SCIENCE MAJORS TOOK LITTLE WORK IN MATHEMATICS AND THE BIOLOGICAL AND PHYSICAL SCIENCES, AND (4) PROFESSIONAL SCHOOL MAJORS TOOK A SIGNIFICANT PROPORTION OF WORK IN THE COLLEGE OF LIBERAL ARTS WITH A HEAVY EMPHASIS ON PROFESSIONAL SPECIALIZATION. Report AC-65-66-1

April 1966

SECTION I

Assembly and Processing of the Data

This report represents an examination of selected significant characteristics of the programs of study of the 1965 graduating class of the University of Connecticut numbering 1,612 students. The central theme is variations in study programs of students who major in different areas of study. The key statistic is -- proportions of total course work taken by students in each major in each area of study. A subsequent report will examine the quality point ratios of majors in study areas. The basic data will make possible a series of reports on similar topics.

A. Parameters Summarized

No. of cases . . . 1,612

No. of majors . . . 52 (see Table 1 for list).

No. of areas of study . . . 64 (The 52 majors + 12 other areas not recognized as a major, see Table 1 for list)

No. of credits . . . 203,927

Mean no. of credits per student . . . 124

In the computer analyses, the students' careers were divided into first and second halves by dividing the total credits of each student by two and rounding to the nearest end of a term.

[a] Not a major--recorded in error.

[b] Finance & Insurance show in tables as both study areas and majors, but courses in these study areas were included in Business. Finance is now a study area.

Key to Asterisks:

* First level total: Groupings of departments in College of Liberal Arts & Sciences or a Professional School.

** Second Level Total: College of Liberal Arts & Sciences and Professional School Totals.

*** Grand Total.

B. The Data

Transcripts of all of the 1,612 graduates of June, 1965 were converted to punched card form. The following information was recorded:

1. For each student:

   a. name

   b. number

   c, sex

   d. major

2. For each semester:

   a. Semester date: e.g. Fall, 1964, Spring 1962

   b. Semester number, the serial number of the semester for that student. Most students would have semester numbers 1 through 8 but many took more than 8 semesters to complete their programs of study.

   c. Institution code to indicate where the work was taken, e.g., Storrs, Hartford Branch, Stamford, Torrington, Waterbury, State Colleges, Other Connecticut and other states.

3. For each course:

   a. No. of credits

   b. Grade

   c. Departmental or school code

   d. Course number

More than 16,000 cards were generated, one for each semester for each student. Each student required about 10 cards of data, averaging about 60 columns of punching. Therefore nearly a million entries were recorded, punched and verified and eventually placed on magnetic tape. Some important procedural decisions were made during the data assembly process and these

are listed below. Furthermore, the analyses described herein do not utilize all of the data assembled. For example, the institutional code and the semester numbers are not used at all. Course numbers are not utilized since the analyses deal only with department and school identity. Rich data are available on the magnetic tape for additional curriculum research.

C. Characteristics and Limitations of the Data and the Processing Procedures

In a project utilizing a large mass of intricate information there will always be certain characteristics and occasionally limitations in the data and procedures under which the data are processed which should be recognized in the interpretation of the results of an analysis. This study is no exception.

1. Visual recording of data. Although virtually all of the information used in the study was previously on punched cards, limitations on time and space were cited by the data processing office as reasons not to retain these data. Therefore, data for this study had to be transcribed from source records -- microfilm copies of student transcripts. This exacting process was performed by three faculty wives [1] who were part time employees of the registrar's office and thoroughly familiar with the type of records maintained there. Great, great care was taken to assure accurate transcription of the data but some few errors surely exist in the nearly 1 million entries. Errors would not be systematic and should be randomly distributed amidst the data.

2. Interpretations of data from other institutions. Transcript entries for work taken at other institutions show only work for which credit was given at the University of Connecticut. From the course titles of the other institutions

---

[1] Ann Marie Savos, Mary Jane Schroeder, Betty Wexler

an equivalent University of Connecticut course number and department code was selected and entered as data. Grades and course numbers are not available for transferred work.

3. Changes of major. The major recorded for each student is that shown as the official major at the time of graduation. Many students changed their majors during their careers and each of these changes would probably be associated with an alteration in study program. Again, the effects are probably random; since changes in major probably occur in approximately equal proportions among the departments and schools of the university. Timing of major changes within a student's career also affects the significance in alteration of programs of study. Nevertheless, the data for, say, Political Science majors is descriptive of the study programs of those students who, upon graduation, were identified as Political Science majors.

4. Precision of definition of schools and departments. The list of schools and departments on page 15 and 16 of the 1965-66 Catalog of the University of Connecticut was used to describe the organization of the university. The schools and departments differ greatly in the precision with which they divide the total student group. For example, a single department, English, with 227 or 14% of the total group of 1,612, is larger than all of the professional schools and all but two of the broad groupings of the departments of the College of Liberal Arts and Sciences. However, the other smaller units are often subdivided into departments. These differences result in percentage data for rather fine divisions of the university being compared with coarser divisions elsewhere. However, this is, after all, the way the university is organized.

5. Masking of dispersion. In both analyses an extensive array of data are reduced to composite data for groups of students. For example, on Page 8 of Appendix A one finds that the 53 Economics majors took 7.11% of their total 6,459 credits in the study area of English. It is possible but not probable that among the 53 Economics majors were some who took over 10% in English and some who took less than 5%. Another type of analyses would subsequently be possible in which individual students are arrayed against a set of intervals of the percentage scale and thereby reveal this type of dispersion.

6. Inadequacy of the total number of cases. At first glance it would seem that a population of 1,612 would be more than adequate. However, when the total population was divided among 52 majors of widely varying sizes overly small number of cases emerged for certain majors. This variation is shown in Table 4 and Appendix A2. Percentages based on numbers of majors below, perhaps, eight are certainly a shaky basis for conclusions. This problem is overcome to a considerable extent by the availability of groupings by broader areas in the tabulations. This study could be repeated with an accumulation of several years' graduating classes to produce larger numbers of cases in smaller departments. However, then periodic changes in university requirements would become a factor.

7. A Disclaimer. There is considerable lack of agreement among educators, students and administration about the desirability of certain curriculum practices upon which this study touches. The measurement of "concentration" and "breadth" in study programs to which this report is addressed, carries to some people connotations of good or of evil. Other than the fact that the study measures these dimensions of the study programs of

the students, no implications are made that "concentration" or "breadth" is good or evil.

D. Related Studies

Two paralleling studies are available for guidance and possible comparisons of data. The latter may not be appropriate because of differences in methodology.

1. "Undergraduate Curriculum Patterns: A Survey of Baccalaureate Programs in Selected Fields, 1962-63." USOE Bulletin 1965, No. 19.

This document deals with 14 selected areas of study in a nationwide sample of institutions. The basic statistic used is percent of credit hours required for graduation in the several curricula. In the present study a somewhat different statistic was basic -- percent of credit hours actually taken. The difference between these two statistics is not great. In general, findings for the University of Connecticut conform to the findings in the national study of requirements with a possible tendency for the actual programs of University of Connecticut graduates to have more "concentration" than the "requirements" of the national sample.

2. "The Undergraduate Study Programs of Recent University of Oregon Graduates by Student Majors," College of Liberal Arts, University of Oregon, April 1965.

This study used almost identical methodology except that the First and Second Half analyses of programs and the entire QPR analysis were omitted. Different grouping of majors were used. Humanities and the natural sciences (Biological, Mathematical and Physical) were more concentrated, social sciences less concentrated. Since the University of Oregon lacks most of the Professional Schools of the University of Connecticut, no comparisons in these areas of study are possible.

There are just enough differences in methodology and university organization, between the present study and these two seemingly comparable investigations to preclude formal statistical efforts to interrelate data.

SECTION II

Proportions of the Course Work of Majors Taken in Each Study Area

A. Introduction

The central focus of this report for most readers is this analysis of "who takes what." During the data collection, processing and analysis phases of the study these words, "who takes what," were used to describe the study. Perhaps this somewhat colloquial expression is the easiest and most explicit description of the study process and its results.

The detailed data of the computer analysis are reproduced in Appendix A in three sections:

A1. Breakdown of credits (Pages 1 - 6)
A numerical cross-tabulation of the number credits taken by each group of 52 majors in each of the 64 areas of study.

A2. Numbers of majors and total credits and mean credits by majors (Page 7)

A3. Percentages of total credits of each major in each study area. (Pages 8 - 13) This section parallels the numerical distribution in Section A1. It simply divides the numerical count of credits in each major in each study area by the total credits of that major.

A4. Matrix similar to A3 for First Half of Students' Careers (Pages 14 - 19)

A5. Matrix similar to A3 for Second Half of Students' Careers (Pages 20 - 25)

Breakdowns of credits in numerical form are available for the first and second halves, but are not reproduced herein.

The detailed data in Appendix A are supplemented and analyzed in the several tables and text which follow.

B. Analysis by Broad Subject Category

The total instructional offerings of the University of Connecticut were divisible into 13 broad areas suggested by the lists in Table 1. Proportions of total credits taken by each group of majors in each broad study area are summarized in Table 2. Intersections of each major with each study area are spotlighted by heavy lines in Table 2. These data clearly indicate that broadly defined majors take by far the heaviest proportions of their work in their own broadly defined study areas ranging from a low of 23.07 per cent for Education in Education to a high of 52.97 for Fine Arts in Fine Arts.

Apart from the obvious first observation of percentages each broadly defined major takes in its own broadly defined study area, many other interesting data may be extracted from Table 2, as follows:

1. Majors in the College of Liberal Arts and Sciences took 85.63% of their work in the study areas of that College. However, students majoring in the professional schools took less than half of their work in the professional schools (49.80%) attesting at least a modicum of effectiveness of the university's liberalization requirements and the students' interests in diversification of program.

2. Majors in the College of Liberal Arts and Sciences took very little work in the Professional Schools and most of what was taken was in the Fine Arts which are in many ways as closely related to the Humanities as they are to their official position among the professional schools.

3. The bottom row of Table 2 provides a percentage distribution of the total credit load borne by each of the broad study areas of the university. The College of Liberal Arts and Sciences provided 67.36% of all of the nearly 204,000 credits offered to the 1,612 students in

Table 2. Macroscopic Analysis by Broadly Defined Majors and Study Areas.
Percentage of Credits Taken by Major in Each Study Area.

this study. The remaining 32.64% of the credits were offered in the professional schools. Of the broad study areas, the Social Sciences offered the largest proportion of the total, 25.93%. A subsequent analysis will show, however, that when study areas are defined more precisely, English in the Humanities leads all of the individual social sciences in this percentage.

4. Although no precise statistical treatment is attempted, it is possible to gain some idea of comparative diversification of programs of majors by inspecting the breadth of spread of percentages across the rows of Table 2. For example, among the five major broad areas of the College of Liberal Arts and Sciences, the Biological Science majors had more diversification than the other four -- the lowest percentage (34.17%) in their own study area and relatively high percentages in three of the other four areas (18.18% in the Physical Sciences, 15.73% in the Humanities and 15.34% in the Social Sciences). Much the same is true of two other majors in the College of Liberal Arts and Sciences: Mathematics and the Physical Sciences. However, the remaining two broad majors in the College of Liberal Arts and Sciences, Humanities and Social Sciences did not display this phenomenon of breadth of study. Humanities majors studied the social sciences in quite large proportion (26.92%) and to a lesser degree, Social Science majors reciprocated. But both groups of majors took comparatively low percentages in the Mathematical, Biological and Physical Sciences. To some extent, the Humanities and Social Sciences majors accounted for this difference by slightly higher percentages in the Fine Arts.

As a result of their very low percentage in their own study area, Education majors showed somewhat more breadth among the study areas of the College of Liberal Arts and Sciences and in Fine Arts than did the other Professional Schools. Business Administration also showed considerable breadth among the study areas of the College of Liberal Arts and Sciences.

C. Detailed Analysis by Departments

The preceding analysis dealt with only 13 broad divisions of the majors and the study areas. Adequate numbers of cases in each grouping were assured. More detailed analysis is possible using the full array of 52 majors and 64 study areas. In these analyses the subdivisions of the Foreign Language Department were not used.

1. Specialization. As a first step toward analysis by department, a combination of detailed departments for majors and broadly defined study areas were used. Table 3 shows the percentage of work taken by the 47 majors (subdivisions of the Foreign Language Department are omitted) in each of the 13 broad study areas. Although more specific because they describe separate departments, the contents of Table 3 clearly support the findings for broad majors shown in Table 2.

Majors in the departments of the College of Liberal Arts and Sciences took their largest amounts of work in their own study area followed by the other study areas of the college. Relatively low proportions of the work of majors in the College of Liberal Arts & Sciences were taken in the professional schools and especially if the amount taken in the Fine Arts is subtracted from the Professional Schools. The departmental major analysis does disclose some interesting and for the most part expected instances of moderately high proportions of the work of majors in the College of Liberal Arts and Sciences departments in the Professional Schools. Majors in departments which are secondary school teaching areas -- English, Foreign Languages, History, Speech -- took relatively high proportions in Education.[1]

Economics majors took a significant share of their work in Business Administration. This anticipated relationship was not paralleled by one that

---

[1] This statement is a however good example of the need for analysis on an individual student basis expressed in paragraph C6 of Section I. For example, Table 3 discloses that Foreign Language majors took 8.37% of their work in Education and that Mathematics majors took 3.46%. It is likely that individual students in these two majors who were preparing for teaching careers probably took about equal proportions in Education. The fact that the Foreign Language majors as a group took more than twice as high a proportion in Education is probably because a larger segment of that group of majors was preparing for secondary teaching.

Table 3. Percentages of the Work of Departmental Majors Taken in Each of the 13 Broad Study Areas.

could be expected between Mathematics and Physics and Engineering.

Majors in most of the Professional School departments took significant proportions of their work in those departments of the College of Liberal Arts and Sciences with a clear relationship to their professional specialization. For example: (not an all inclusive list)

Agricultural Economics	18.32% in the Social Sciences
Animal Diseases	31.46% in the Biological Sciences
Plant Sciences	19.92% in the Biological Sciences
Finance	30.51% in the Social Sciences
Chemical Engineering	25.33% in the Physical Sciences
Electrical Engineering	16.22% in the Mathematical Sciences
Theater	24.46% in the Humanities
Child Development and Family Relations	26.34% in the Social Sciences
Physical Therapy	19.84% in the Biological Sciences

Table 4 initiates analysis of departmental majors in relation to departmental study areas. Percentages of work taken by departmental majors in their own department are the central focus of Table 4. This measurement is provided for the whole career of majors and the first and second half of careers.

Among the departments of the College of Liberal Arts and Sciences, the highest percentage of specialization was 33.33% for Chemistry and the lowest was 19.28 for Bacteriology. Ranges are not great and are certainly affected by the problem cited in paragraph C4 of Section I regarding disparity in sizes of the departments. The low percentage for Bacteriology could be caused by a smaller number of offerings than are available in other departments.

Percentages of specialization were considerably higher in the departments of the professional schools. The range was from a high of 55.88% in Nursing to lows below 20% in several of the departments of the Schools of Agriculture and Business Administration. Percentages of specialization were also comparatively high in Art and Music. The percentage for the School of Education, 23.07%, was

Table 4. A Measure of Specialization. Numbers of Majors, Total Credits, Mean Numbers of Credits and Percent of Credits Taken in Their Own Study Area, Whole Career, First and Second Halves.

***GRAND TOTAL	1,612	203,927	127	-	-	-
First Half			62			
Second Half			64			

[a]Finance and Insurance show in the Appendix tables as both study areas and majors, but courses in these study areas were included in Business. Finance is now a study area.

Key to Asterisks:

* First Level Total: Groupings of departments in the College of Liberal Arts and Sciences or in Professional Schools.

** Second Level Total: College of Liberal Arts and Sciences and Professional School Totals.

*** Grand Total

relatively low. It must be recognized also that the 66 majors in Education were primarily those preparing to be elementary school teachers. Future secondary school teachers and also some future elementary teachers were classed as majors in the subject areas they intended to teach.

D. Comparison of the First and Second Half of Students' Careers

Appendices A4 and A5 contain data for the first and second halves of the careers of the students[1] similar to that contained in Appendix A3 for the whole career of the students. The purpose of the division into first and second halves was to at least partially answer the "when" corollary to the "who takes what" question -- who takes what and when.

In virtually every department the percentage of concentration was much higher in the second half, especially in the professional schools. The highest percentage of concentration in the first half was in Music (35.85%) and another Fine Arts department, Art, was second (30.15%).

The highest percentages of concentration in the second half were found among the professional schools: 77.56% in Nursing, 72.47% in Civil Engineering and other above 70% in Art, Music and Pharmacy. Among the departments of the College of Liberal Arts and Sciences, second half percentages of concentration were about 35-40%. Chemistry and Geology at 42.97% and 48.79% respectively were quite high. Complete listings of the percentages of concentration of each department are provided in Table 4.

---

[1] The halves of the careers were determined by counting the students' total credits, dividing by two and rounding to the nearest end of a term. Because of this rounding method, the mean second half of 64 credits was 2 more than the mean first half -- a negligible difference.

2. Breadth. It is not feasible to include in the text a table for departments comparable to Table 2 for the broader divisions showing a complete matrix for all segments. Actually Appendix A-3 is such a matrix.

Table 5 constitutes a means of providing information on breadth and also on the topic of what are the next most taken study areas after the major area by each group of majors. This issue is closely related to the materials shown on Page 6 of the recent Accreditation Survey regarding related and supplementary areas for each major.

Examination of Table 5 clearly indicates that after the major department, students confine most of their remaining study to a relatively small number of departments. These tend to be those in which diversification requirements of the university are operative. Philosophy majors stand out in Table 5 as a group which took more than 40% of their work in a large number of different departments. Table 5, however, contains few surprises.

E. Analysis of Departmental Offerings.

As cited previously, the bottom row of Table 2 indicates the total percentage of all credits which were offered by each broad study area. Similar percentages for departments can be extracted from Appendix A3. The English Department with 10.46% of the total offering (credits) to the 1,612 students leads all other departments in this measurement.

Departments offer courses to two broadly defined categories of students -- majors and non-majors. Table 6 presents an analysis of the percentage of the total credits offered by each department to eventual majors in that department. Among the departments of the College of Liberal Arts and Sciences, English offered the highest percentage to its own majors, 39.88%.

**Professional Schools	66,554	52,355	78.66
***GRAND TOTAL		203,927	

[a] Finance & Insurance show in tables as both study areas and majors, but courses in these study areas were included in Business. Finance is now a study area.

Key to Asterisks:

*First level total: Groupings of departments in College of Liberal Arts & Sciences or a Professional School

**Second Level Total: College of Liberal Arts & Sciences and Professional School Totals.

***Grand Total.

Very much lower percentages were found for other College of Liberal Arts and Sciences departments. For example, of 6,957 credits offered by the Physics Department, only 252 were taken by the 7 students who graduated as Physics majors producing a percentage of 3.61%. The wide range in this percentage is due to many factors among which are probably the following:

1. Size of a department.

2. Relationships to other College of Liberal Arts and Sciences departments and the professional schools. For example, the percentage for Physics is surely affected by the logical impact of majors in Chemistry, Mathematics and Engineering in Physics classes.

3. Changes of majors during students' careers.
